- Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billand at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                        /dev_stage="Adult"

(http://www.jax.org/resources/documents/dnares/). The DNA was bytacoynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of PWD42 (gil4732114)[pb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XLIO-Gold (Stratagene) cells and.selected for ampicillin resistance."

Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond, Clark, C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.) The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing, A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

- Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billand at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

```
(http://www.jax.org/resources/documents/doares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gill772114) fpl.ARL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for amplicillin resistance."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                This represents the nucleotide sequence of a banana bunchy top virus (BBTV) DNA I (clone 7-4-2) circular single stranded (css) DNA. The invention provides nucleic acid sequences associated with BBTV that can be used in a PCR technique for detecting BBTV. The nucleic acid sequences (AAV71830 to AAV71833) are used as the basis for the construction of PCR primers, to detect BBTV infection. The PCR technique is used for detecting BBTV in plant tissues (preferably banana especially Musa species). The virus, one of the most important banana species viruses, causes phloem damage and is transmitted by aphids. PCR detection gives accurate, reliable and specific determination of absence

```
The present invention describes two circular single-stranded DNAs associated with banana bunchy top virus (BBTV) and the encoded proteins. Also described is a method of detecting the BBTV virus using the polymerase chain reaction (PCR). The present sequence represents a BBTV related nucleotide sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to DNA promoter sequences derived from components of Banana Bunchy Top Virus (BBTV). The DNA molecule includes a promoter

to detect BBTV infection. The PCR technique is used for detecting BBTV in plant tissues (preferably banana, especially Musa species). The virus, one of the most important banana species viruses, causes phloem damage and is transmitted by aphids. PCR detection gives accurate, reliable and specific determination of absence or presence of the

                    and is adaptable for promoting transcription of a cloned gene in a plant expell. The promoter, included in a DNA chimeric vector, is useful for the expression of a gene in a plant cell. The inclusion of the polyubiquitin 1 (ubil) intron sequence into BBTV promoter constructs enhances promoter fargment derived from BBTV-Sl and includes an open reading frame fragment and an intergenic region fragment.
sequence derived from an untranslated portion of any one BBTV components

AAV71834
```

(BBTV) DNA II (clone 2) and reperesents a subgenomic DNA. The invention provides nucleic acid sequences associated with BBTV that can be used in a PCR technique for detecting BBTV. The nucleic acid sequences (AAV71830 to AAV71833) are used as the basis for the construction of PCR primers,

This represents the nucleotide sequence of a banana bunchy top virus

Disclosure; Fig 12A-C; 27pp; English.

detection of the virus

```
associated with banana bunchy top virus (BBTV) and the encoded proteins. Also described is a method of detecting the BBTV virus using the polymerase chain reaction (PCR). The present sequence represents a BBTV related nucleotide sequence from the present invention.

This represents the nucleotide sequence of a banana bunchy top virus (BBTV) DNA II (clone 2-17) circular single stranded (css) DNA. The invention provides nucleic acid sequences associated with BBTV that can be used in a PCR technique for detecting BBTV. The nucleic acid sequences (AAV71830 to AAV71833) are used as the basis for the construction of PCR primers, to detect BBTV infection. The PCR technique is used for detecting BBTV in plant tissues (preferably banana species). The virus, one of the most important banana species viruses, causes phloem damage and is transmitted by aphids. PCR detection gives accurate, reliable and specific determination of absence or presence of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes two circular single-stranded DNAs associated with banana bunchy top virus (BBTV) and the encoded proteins.

The invention relates to DNA promoter sequences derived from components of Banana Bunchy Top Virus (BBTV). The DNA molecule includes a promoter sequence derived from an untranslated portion of any one BBTV components and is adaptable for promoting transcription of a cloned gene in a plant expression of a gene in a plant expression of a gene in a plant cell. The included in a DNA chimeric vector, is useful for the expression of a gene in a plant cell. The inclusion of the polyubiquitin (ubil) intron sequence into BBTV promoter constructs enhances promoter activity. The present sequence represents the DNA sequence of BBTV S21 promoter and S2L promoter fragments.

The subterranean clover stunt virus (SCSV) genome has at least 7 distinct ssDNA components, designated segments 1-7 (AAT13160-66), each congy. 1 major open reading frame and a non-coding region. Segment 6 is predicted to be a viral replication-associated protein gene. Genetic constructs useful in the genetic engineering of plants (esp. legumes) comprise 1 or more heterologous gene(s) operatively linked to a promoter region, and in some cases also a terminator region, selected from segments 1-7. The transcription regulators facilitate expression of foreign genes in plants and also facilitate control of levels of gene expression in different plant tissue types.
                                                                                                                                                                                                 61 aaatacgaacc---cettagttatettgggttegaceatgtgeatgtactegtatttgec 117

polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in dispinositics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to rescree normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as
                                                                                                                                                                                                                                                                                          ö
The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and anino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in tresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques
    food supplement. (II) and its binding partners are useful in medical
                                                                                                                                                                                                                                                                                                                                                                                                                           1411 gttctggccagggcaatcagggcggagaaaagaaataaagggtattcaattaggaaaagag 1470

          quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
restore normal activity of (II) or to treat disease states involving
                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome

considering expressed genes. (I) is useful in gene therapy techniques for identifying expressed genes. (I) is useful in gene therapy techniques for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical ingorages involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a DNA fragment from the component 1 of the Banana bunchy top virus (BBTV). The DNA molecules can be used as diagnostic probes or primers or can be inserted into plants or other organisms e.g. to produce virus-resistant plants or to act as promoters, enhancers or termination signals.

The DNA molecules can be used as diagnostic probes or primers or can be inserted into plants or other organisms e.g. to produce virus-resistant plants or to act as promoters, enhancers or termination signals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     64 tacgaacccttagttatcttgggttcgaccatgtgcatgtactcgtatttgccaatgtc 123
